

SAHO – Product Requirements Document

Phase 5 – UI/UX & Accessibility Specification

5.1 UX Philosophy

Every interface must reduce cognitive load. During a crisis the user should never wonder what to press next. The design language should feel calm, supportive and reassuring rather than clinical.

5.2 Design Principles

Principle	Implementation
One Decision at a Time	Show a single primary action on each screen.
Compassion First	Acknowledge emotions before presenting actions.
Large Touch Targets	Minimum 48x48 px interactive elements.
Minimal Text	Use icons and concise language.
Immediate Feedback	Animations and haptics confirm user actions.

5.3 Visual Design System

Primary Color: Deep Blue (Trust) Secondary Color: Emerald Green (Recovery) Accent: Warm Amber (Attention) Error: Soft Red Background: Neutral Off-White / Dark Mode
Typography: • Headings: Bold, high contrast • Body: Readable sans-serif • Minimum body size: 16px • Line height optimized for readability

5.4 Screen Specifications

Landing Screen • Single 'SAHO NOW' CTA • Calm illustration • Voice-first interaction
Recovery Screen • Breathing animation • AI guidance card • Three action checklist
Caregiver Mode • High-contrast teleprompter • Swipe-based emergency instructions
Education Hub • Short learning cards • Audio narration support

5.5 Motion Guidelines

Animations must communicate reassurance rather than excitement. • Slow breathing pulse • Smooth page transitions • Respect 'prefers-reduced-motion' • Avoid flashing or distracting effects.

5.6 Accessibility Requirements

WCAG 2.2 AA compliance is mandatory. Requirements: • Keyboard navigation • Screen reader compatibility • ARIA labels • High color contrast • Visible focus indicators • Captions for audio • Voice-first workflows • Large tap targets

5.7 Crisis UX Rules

Never display more than three primary actions. Never hide emergency options. Keep emergency contacts reachable within one tap. Use plain language. Avoid medical jargon.

5.8 Error & Empty States

Errors must reassure users and provide a recovery path. Examples: • AI unavailable → Offer offline guidance. • Camera failed → Retry or upload image. • No internet → Offline emergency resources.

5.9 Performance Targets

• Initial screen under 2 seconds • Responsive on mobile first • Lighthouse Accessibility >95 • Lighthouse Performance >95

5.10 Acceptance Criteria

The UX is approved when users can complete core crisis workflows without typing, understand every screen within seconds, and successfully navigate using touch, keyboard, voice, or assistive technologies.
